

Installing Pastoral Care Cloud

Before installing Pastoral Care Cloud it is assumed Pastoral Care 14 has already been installed on the computer that Pastoral Care Cloud is going to be installed on.

Pastoral Care Cloud only needs to be installed on one computer for the church to run a Cloud network.

The computer in which Pastoral Care Cloud is installed on is where the master Pastoral Care database resides on, this might be the churches file server or it can be as simple as on the pastor's laptop for a small church.

Pastoral Care Cloud installs a program called Cloud Host; this program becomes the bridge to link remote users with the Pastoral Care's master database.

To install Pastoral Care Cloud, download the Cloud Setup program from the Pastoral Care Download page on our web site and then run it. Once the program has been installed and run for the first time you will be given an option to run the Setup Assistant to configure Pastoral Care Cloud.

The first page of this setup assistant will give you an option to view and print a document which explains everything about Pastoral Care Cloud. It is strongly recommended that you take the time to read this document to quickly become an expert in managing your own church Cloud network.
